ARKCA Corporate — Website Security Incident Summary

Incident Period: August–September 2026
Website: arkcacorporate.com

1. What happened

The website was compromised and malicious SEO content was injected into the WordPress installation. The attacker appears to have gained access to the **WordPress files/database**, created an unauthorized WordPress Administrator account, modified website content, and injected malicious canonical/SEO content targeting gambling keywords.

The **most likely entry point was an outdated All in One SEO plugin**, which was not updated at the time. However, **this has not been conclusively proven**, as the available logs do not establish the exact vulnerability used.

2. Evidence of the attack

- **9 Aug 2026:** Suspicious directory structure created under:
  `wp-includes/sitemaps/providers/amp/toto/`
- **8 Sep 2026 – 21:15:**
  `wp-includes/sitemaps/providers/amp/toto/index.php` was created/modified.
  Imunify360 subsequently identified this file as malicious. It was later removed.
- **4 Sep 2026:** FTP activity through `admin@arkcacorporate.com` accessed/modified:
  - `wp-includes/compat.php`
  - `wp-includes/load.php`
  - `.htaccess.bk`
- **11 Sep 2026:** Further suspicious FTP activity occurred involving:
  - `wp-includes/load.php`
  - `wordpres.load.php`
  - `wp-config.php`
  - `terms-and-conditions/index.php`
- Imunify360 detected compromised versions of:
  - `wp-includes/load.php`
  - `wp-includes/compat.php`
  - `wp-includes/sitemaps/providers/amp/toto/index.php`
  - `terms-and-conditions/index.php`

The hosting provider subsequently **reinstalled the WordPress core**, after which the core passed the official WordPress checksum/integrity verification.

3. Website and SEO manipulation

The attacker added gambling-related SEO content and canonical references, including:

- `PLNTOGEL`
- `TOTO4D`
- `SLOT GACOR`

These were associated with external gambling domains and were found in previously compromised website content.

The attack also resulted in malicious pages/content being exposed to Google, causing them to become indexed and receive **rapid impressions and clicks**.

4. Google Search Console compromise

Unauthorized Google Search Console ownership was also identified.

Important events:

- **24 Apr 2026:** `syah12rizal12@gmail.com` successfully verified ownership.
- **25 Apr 2026:** `srzl12semangat@gmail.com` successfully verified ownership.
- **12 & 17 May 2026:** Anonymous HTML-file verification succeeded.
- **23 Sep 2026:** `syah12rizal12@gmail.com` successfully re-verified ownership using an HTML file.
- **29 Sep 2026:** ARKCA Corporate removed that verification.

The repeated **HTML-file verification** indicates that an unauthorized party had the ability to place verification files on the website.

> **Important:** The evidence confirms unauthorized GSC access, but it does not conclusively prove that the GSC account owner and the person who compromised WordPress were the same individual.

5. Cleanup completed

The following actions have been completed:

- Removed unauthorized WordPress Administrator account.
- Removed malicious SEO/gambling content.
- Removed suspicious/backdoor files identified during the investigation.
- Reinstalled/verified WordPress core files.

- Reviewed WordPress users, plugins, themes and cron jobs.
- Reviewed FTP and website access logs.
- Updated **All in One SEO**, which was the remaining plugin requiring an update.
- Removed unauthorized Google Search Console ownership/verification.
- Removed/unindexed malicious pages and SEO content.
- Rechecked the website for remaining gambling/SEO injections.

6. Current status

The identified compromise and malicious SEO content have been cleaned. WordPress core files have been reinstalled and verified against official WordPress checksums.

The **exact original vulnerability/entry point cannot be proven from the available logs**. The outdated **All in One SEO plugin remains the primary suspected entry point**, but this should be described as a **likely cause, not a confirmed fact**.

Recommended next step: continue monitoring Google Search Console, server logs and WordPress activity after the cleanup, while keeping WordPress, plugins and themes fully updated.
