ARKCA CORPORATE / WEBSITE REDEVELOPMENT

Website Discovery & Architecture Review

Client + SEO Specialist Review Draft

Purpose

Review the proposed navigation, service categorisation, page scope and URL approach before these decisions are finalised.

CURRENT STATUS

Research and planning reviewed

Competitor design and website structures have been studied. New website development is underway. The proposed information architecture remains open for client and SEO specialist feedback.

Review focus

01 **Navigation**	**02** **Service categories**	**03** **Pages to retain or change**	**04** **URL and SEO decisions**

This is a working review document, not a final sitemap or approved URL/redirect map.

1. Project overview

ARKCA Corporate’s website is being rebuilt in Next.js to improve clarity, service discovery, usability, performance and maintainability while protecting legitimate existing SEO value.

2. Research and discovery completed

The planning work has focused on understanding the current website and finding a clearer way for users to navigate ARKCA’s regulatory and compliance services.

Existing website review	Reviewed the current service hierarchy, navigation patterns, page types and existing URL structure. The current menu is deep in places, and some parent labels do not lead to dedicated hub pages.
Competitor design and structure study	Studied competitor websites to inform a more intuitive navigation model and a professional, modern user experience. The intent is to learn from patterns—not copy another brand’s design.
Service grouping	Developed a proposed grouping of EPR, licences and certifications, business setup, and import/export-related services so users can browse by need as well as by known service name.
SEO-aware planning	Existing pages and URLs are being considered as assets to review, not items to rename or remove by default. Final URL and page-level decisions should be validated against SEO data.

What is not being claimed: this document does not treat the proposed navigation, final page list, URL changes, redirects or visual direction as approved. SEO data should determine which URLs must remain unchanged and which, if any, need a change.

3. Proposed website navigation

The following is the recommended top-level structure for review. The aim is to make the major service areas clear, reduce menu complexity and give each group a useful destination page.

PROPOSED MENU ITEM	WHAT IT SHOULD CONTAIN	REVIEW POINT
EPR & Environmental Compliance	EPR categories and relevant environmental compliance services, with related registration, compliance and task pages where they exist and are relevant.	Confirm categories, service availability and how task pages are grouped.
Licences & Certifications	Product/regulatory approvals, business credentials and import monitoring registrations, based on services ARKCA currently offers.	Confirm the included services and subcategories.
Business Setup	Company formation, LLP, OPC, GST, ROC-related services and DPIIT Startup, subject to confirmation.	Confirm scope and whether any services belong elsewhere too.
Import, Export & Customs	IEC, ICEGATE, AD Code, Advance Authorisation, RCMC/export-related services and relevant import/customs compliance pages.	Confirm overlap with Licences & Certifications and Business Setup.
Insights	Blogs, the A to Z EPR Series and FAQs. Add regulatory updates only if they can be maintained.	Confirm content types to retain and maintain.
About Us / Contact Us	Company information, trust signals based on verified facts, contact details and enquiry/consultation routes.	Confirm company facts and current contact details.
Book a Consultation	A clear call-to-action visible from key website journeys.	Confirm the preferred booking destination and wording.

Navigation principles behind the proposal

- Each top-level service group should lead to a useful landing page, rather than being only a label in a dropdown.
- A service may be linked from more than one relevant group, but should point to the same canonical service page rather than creating duplicate pages.
- Keep an All Services directory if the client confirms it remains useful; organise it by service group and include only active services.
- Design the menu for mobile as well as desktop, with clear labels and manageable levels of nesting.

4. Page scope and URL strategy

The page list and URL decisions need to be reviewed together. A change in navigation does not automatically require a change to the URL of an existing page.

Recommended page/content approach

- **Keep existing pages where practical.** Review their purpose, accuracy, traffic and search intent before removing, merging or rewriting them.
- **Keep service topics distinct when the intent is distinct.** Do not combine EPR task pages merely to reduce page count; review each against the service offered and SEO evidence.
- **Preserve existing public URLs by default where they are appropriate.** Some legacy URL patterns differ. Do not standardise or rename slugs without a documented SEO reason and an approved destination.
- **Confirm the full page inventory.** Review service pages, blogs, A to Z EPR content, FAQs, All Services and utility pages. Retain only services and content the business confirms are current.
- **Validate business and regulatory content.** Company facts, service availability, legal/regulatory details, fees and timelines need confirmation from the appropriate client-side reviewer.

SEO specialist review before final URL decisions

- Use Google Search Console and GA4 to identify priority pages and existing search/traffic value.
- Review keyword-to-page mapping, search intent and backlinks before recommending a URL change, merge or removal.
- Create a separate old-URL → approved destination mapping for any changes; test redirects to avoid chains, loops or irrelevant destinations.
- Confirm canonical URLs, page titles and descriptions, internal links, XML sitemap and robots.txt as part of technical SEO QA.
- After launch, compare indexing, search traffic and enquiries with an agreed baseline. Rankings cannot be guaranteed.

> **Approval gate:** No URL rename, page removal, merge or redirect should be treated as final based only on this proposed structure. The client confirms business scope; the SEO specialist validates search and backlink implications; the final URL map is then approved.

5. Client & SEO specialist review checklist

Please mark each decision as **Approved**, **Change requested** or **Needs discussion**. Add comments where a change is requested. The goal is to close the information-architecture decisions while development continues in progress.

ITEM TO REVIEW	APPROVED	CHANGE	DISCUSS	COMMENTS / ACTION REQUIRED
Top-level navigation	■	■	■	
Service categorisation and menu grouping	■	■	■	
Service list under each category	■	■	■	
Pages to retain, update, merge or remove	■	■	■	
Existing URLs to preserve or change	■	■	■	
SEO recommendations / redirect mapping	■	■	■	

6. Feedback requested from the client

A. Changes to the proposed decisions	Please list any changes you would like us to make to the proposed navigation, service categorisation, page list or URL approach.
B. Additional points or ideas	Share any missing services, pages, features, business priorities, content requirements or ideas you would like to see on the website.
C. Design and website references	Share links to websites you like, or specific examples of layouts, navigation, page sections, visual styles or interactions you want us to consider. If possible, note what you like about each reference.

Suggested response format: Reply with the decision item, the requested change (if any), and the reason or supporting SEO data where relevant. The SEO specialist should flag any URL/page decisions that require traffic, keyword or backlink validation.

Thank you — your feedback will help us finalise the website structure and align the implementation with both business priorities and SEO requirements.
